The sequence may be expressed in e.g. COS-7 cells. The encoded protein, its ligands or fragments, and antibodies may be used for the treatment of transplant rejection, graft-versus-host disease, autoimmune disease, etc.

                                                                                                                                                                                                                                                                              ACT-4-L-h-1 is a specific binding partner (sbp) to the ACT-4 receptor polypeptide (encoded by this sequence) on the surface of activated CD4 positive B cells. The sbp and its fragments are useful in pharmaceutical compositions to modify a patient's immune response as well as having application in the treatment of transplant rejection, graft versus host disease, autoimmune disease, inflammation, infectious agents, HTLV infected cells or HTV. Specifically the sbd can be used to treat inflammatory bowel disease. The sbd can also be used for screening for immunomodulatory agents able to recognise ACT-4 and for monitoring activated CD4 positive cells or inhibiting infection of CD4 positive cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (GREA/)

                                           The present invention describes the human TRID protein (tumour necrosis of factor (TNF) related apoptosis inducing ligand (TRAIL) receptor without intracellular domain, also referred to as tumour necrosis factor of TRAIL) receptor s (TNRF-5 or TRS)). TRID has cytostatic, immunosuppressive, conotropic, neuroprotective, antiviral, antiinflammatory, anticonvulsant, cardiant, anti-HIV, antiparkinsonian and vasotropic activities, and can be used in gene therapy. The TRID polynucleotides care useful for detecting complementary polynucleotides. TRID proteins and complementary polynucleotides are useful for inducing proliferation of T-cells, endothelial colls and certain haematopoietic cells, to regulate antiviral responses cand to prevent certain autoimmune diseases after stimulation of TRID by cardiated with increased or decreased apoptotic cell death. The TRID collynucleotides, proteins, antibodies, agonists and antagonists are useful in the diagnosis, treatment or prevention of: (a) cancer; (c) diseases associated with increased compensis, utenament or prevention of: (a) cancer; (b) autoimmune disorders; (c) diseases associated with increased in comparison with TRID in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               immunosuppressive; neuroprotective; antiviral; antiinflammatory; anticonvulsant; antiparasitte; cardiant; anti-HTV; antiparkinsonian; gene therapy; restenosis; graft versus host disease; tumour; cancer; apoptotic cell death related disease; autoimmune disorder; cardiovascular disorder; viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acid encoding a TRID polypeptide, also referred to as necrosis factor receptor 5, useful in the diagnosis, treatment prevention of cancer, autoimmune disorders and viral infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  TRAIL receptor without intracellular domain; diagnosis; cytostatic tumour necrosis factor related apoptosis inducing ligand; vasotrop immunosuppressive; neuroprotective; antiviral; antiinflammatory;

RESULT
AAR76996
the Ox-40 antigen was identified (expressed on the surface of activated autoantigen-specific CD4+ T-cells present at the site of inflammation but absent on CD4+ T-cells at non-inflammatory sites) and cDNA encoding the antigen was isolated. PCR primers were designed and used to clone murine Ox-40 cDNA by PCR from RNA isolated from murine CD4+ T-cells activated with concanavalin A. Then the murine Ox-40 cDNA was used to probe a cDNA lambda gtll library from human activated T lymphocytes to obtain human Ox-40 cDNA. The published patent application states that the Ox-40 cDNA sequence is also in SQ ID no. 1, but this sequence is not present in the spec. A nucleic acid having the sequence in SQ ID no 1 and
                                                                                                                                                                                                                                                                      Antigen OX-40 is specifically expressed on the cell surface of antigen activated T-cells. A pluman cDNA encoding the human OX-40 homologue was cloned as follows. Using the Experimental Autoimmune Encephalomyelitis model in rats
                                                                                                                                                                                                                                                                                                                                                                                                Claim 3;

                                                                        The present invention describes peptides and peptide analogues which correspond in primary sequence to a binding loop of a tumour necrosis factor receptor (TNF-R) superfamily member. The compounds are especially designed from a binding loop of TNF-R p55. They are capable of inhibiting TNF binding to its cellular receptors and may be used to inhibit the biological activities of TNF-They may be used in treating TNF-associated conditions such as scute and chronic inflammatory responses, septic shock, cachexia, autoimmunity, graft-versus-host disease, skin allergic reactions, immune complex disease, transplantation rejection and malaria. Administration is, e.g. oral,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Tumour necrosis factor receptor; TNF-R; autoimmune diseases; inflammation; septic shock; cachexia; graft versus host disease; skin allergic reaction; immune complex disease; malaria;

                                                                     The present sequence represents a secondary signalling sequence, which is linked to a non-natural stimulatory primary signalling motif to produce a cytoplasmic signalling motif. The primary motif is efficient at mediating immune cell signal transduction, particularly when incorporated in an intracellular signalling domain of a chimeric receptor. The primary signalling motif can be combined in any way so as to achieve the desired level of activation (or inhibition) of a number of secondary messenger cascades. The signalling motifs are useful in therapy and in the manufacture of medicament for treating or preventing disease in humans or animals. They are are useful for treating human patients suffering from infections diseases e.g. human immunodeficiency virus (HIV) infections, inflammatory/autoimmune diseases such as asthma and eczema, congenital diseases e.g. cystic fibrosis, sickle cell anemia, dermatological diseases e.g. psoriasis, neurological

                                                                                                           The invention relates to a novel nucleic acid encoding an adaptor CC receptor protein comprising an extracellular ligand-binding domain, a CC transmembrane domain and an intracellular signalling domain. The CC intracellular signalling domain comprises the cytoplasmic portion of at CC least one adaptor protein, and the extracellular ligand-binding domain CC is not CDB or a major histocompatibility complex (MHC) class I protein. CC The adaptor receptor protein and the nucleic acid encoding it are useful in therapy. They are useful in the manufacture of a medicament for the CC treatment or prevention of disease in humans and animals. They are useful in the treatment of infectious diseases (e.g. HIV infection).

CC congenital diseases (e.g. cystic fibrosis and sickle cell anaemia).

CC dermatological diseases (e.g. psoriasis), neurological diseases (e.g.) cultiple sclerosis), organ transplant rejection, graft-versus host components of the adaptor receptor protein of the invention. Secondary signalling motif used in the CC invention. Secondary signalling motif used in the components of the adaptor receptor protein of the invention. Motifs were isolated from CD28, CD134 and CD154.

                                                      CC The present sequence represents a secondary signalling sequence, which may be linked to a non-natural stimulatory primary signalling motif CC The primary motif is efficient at mediating immune cell signal CC transduction, particularly when incorporated in an intracellular CC can be combined in any way so as to achieve the desired level of CC can be combined in any way so as to achieve the desired level of CC can be combined in any way so as to achieve the desired level of CC retivation (or inhibition) of a number of secondary messenger cascades. The signalling motifs are useful in therapy and in the manufacture of CC medicament for treating numan patients suffering from infectious are are useful for treating human patients suffering from infectious diseases e.g. human immunodeficiency virus (HTV) infections, congenital CC diseases e.g. psorlasis, neurological diseases e.g. multiple sclerosis, transplant-related disease e.g. organ transplant rejection, graft versus CC constitutions metabolic/idiopathic disease e.g. diabetes, and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel cytoplasmic signalling protein and chimeric receptor protein, useful for treating HIV infection, asthma, eczema, psoriasis, multiple sclerosis, contain non-natural stimulatory primary signalling motif -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Stimulatory primary signalling motif; immune cell; signal transduc chimeric receptor; inflammatory disease; autoimmune disease; asthm eczema; congenital disease; receptor; sickle cell anemia; dermatological disease; psoriasis; neurological disease; multiple sclerosis; transplant-related disease; metabolic disease; organ transplant rejection; graft versus host disease; organ transplant rejection; graft versus host disease;

                                                                                                                                             when incorporated into an intracellular signalling domain of a chimeric receptor. Nucleic acids that encode, and polypeptides that contain, these primary signalling motifs are useful in medicine and research. They are useful in therapy, or in the manufacture of a medicament for treating or preventing disease in humans or in animals. These diseases include infections (e.g. HIV (human immunodeficiency virus) infection), inflammatory or autoimmune diseases (e.g. asthma or eczema), congenital diseases (e.g. cystic fibrosis or sickle cell anaemia), dermatological diseases (e.g. psoriasis), neurological diseases (e.g. multiple sclerosis), organ transplant rejection or graft versus-host disease, or metabolic/idiopathic diseases (e.g. diabetes or cancer). The present sequence is one of a large number of primary and secondary signalling motifs used in the invention. Primary signalling motifs are sequences that transduce either a stimulatory or an inhibitory signal, which regulates primary activation of the T cell receptor (TCR) complex. Secondary motifs impart secondary or co-stimulatory signalling capacity to a molecule in T cells. GS linkers have been incorporated at each

These motifs are extremely efficient at mediating immune cell signal transduction, particularly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Homo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acids encoding polypeptides with expanded primary signaling motifs, for use in gene therapy, particularly for treating or preventing infections, inflammations or autoimmune diseases in humans

                                                                                          multiple sclerosis), organ transplant rejection, graft-versus-host disease and metabolic/idiopathic diseases such as diabetes and cancer. The present sequence is one of a number of sequence blocks (SBs) of primary and secondary signalling motifs. Primary signalling motifs transduce either a stimulatory or an inhibitory signal, which regulates primary activation of the T cell receptor (TCR) complex. Secondary signalling motifs impart secondary cro-stimulatory signalling capacity to a molecule in T cells. Primary and secondary signalling motifs may be used as components of the adaptor receptor protein of the invention. The sequence contains a GS linker at the N-terminus to
                                                                                                                                                                                                                                                                                                                                                                                                                                        The adaptor receptor protein and the nucleic acid encoding it are useful in therapy. They are useful in the manufacture of a medicament for the treatment or prevention of disease in humans and animals. They are useful in the treatment of infectious diseases (e.g. HIV infection), inflammatory and autoimmune diseases (e.g. asthma and eczema), congenital diseases (e.g. cystic fibrosis and sickle cell anaemia), dermatological diseases (e.g. psoriasis), neurological diseases (e.g.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel nucleic acid encoding an adaptor receptor protein comprising an extracellular ligand-binding domain, a transmembrane domain and an intracellular signalling domain. The intracellular signalling domain comprises the cytoplasmic portion of at least one adaptor protein, and the extracellular ligand-binding domain is not CD8 or a major histocompatibility complex (MIC) class I protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antisickling; antipsoriatic; neuroprotective; immunosuppro

                                                            when incorporated into an intracellular signalling domain of a chimeric creceptor. Nucleic acids that encode, and polypeptides that contain, these primary signalling motifs are useful in medicine and research. They are useful in therapy, or in the manufacture of a medicament for treating or preventing disease in humans or in animals. These diseases include infections (e.g. HIV (human immunodeficiency virus) infection), inflammatory or autoimmune diseases (e.g. asthma or eczema), congenital diseases (e.g. cystic fibrosis or sickle cell anaemia), dermatological diseases (e.g. psoriasis), neurological diseases (e.g. multiple sclerosis), organ transplant rejection or graft-versus-host disease, or metabolic/idiopathic diseases (e.g. diabetes or cancer). The present sequence is a secondary signalling sequence used in the co-stimulatory signalling capacity to a molecule in T cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Best Loc

                                                                                                                                                                                                                                                                                                        The present invention relates to a method for treating conditions leading to bone loss. The method comprises administering a purified and isolated osteoprotegerin (OPG) protein (AAF57836-AAF57838 and AAB66974-AAB66976) in conjunction with other substances such as tumour necrosis factor-alpha (TNF-alpha) inhibitors, interleukin (IL)-6. 8 and -18 inhibitors, ICE modulators, fibroblast growth factor (FGF)1-10 modulators and/or platelet activating factor (PAF) antagonists. The method is useful for treating conditions leading to bone loss such as rheumatoid arthritis, multiple sclerosis, osteoprosis, osteomyelitis and asthma. The method is also useful for treating inflammation, systemic lupus erythematosus (SLE) and graft-versus-host disease (GVHD). Other diseases that can be treated include acute pancreatitis, Alzhelmer's disease, anorexia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0x40

The cDNA (AAV32640) encoding OX40 extracellular domain was used in the construction of the chimeric OX40/Fc cDNA (AAV32640). The invention claims for a murine OX40-L cytokine (AAW48975) that binds to the OX40 murine T cell antigen. The OX40-L protein is claimed to be useful for co-stimulation of T-cell production and in binding assays for detecting OX40 for its homologues. The OX40-L protein is also claimed

The Fc fragment may be derived from human IgG1, and the plasmid may be used to transform the CV-1/EBNA (ATCC CRL 10478) monkey kidney cell line. Culture supernatant was purified by affinity chromatography and this was used, together with labeled goat anti-human IgG to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Key

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents the OX40/Fc fusion protein that contains the extracellular domain of mouse OX40 fused to the mutated Fc region of the human IgGl antibody. The fusion protein was used for detecting cDNA clones encoding an OX40 ligand. The invention claims for a murine OX40-L cytokine (AAW48975) that binds to the murine T cell antigen, OX40. The OX40-L protein is claimed to be useful for co-stimulation of T-cell production and in binding assays for detecting OX40 or its homologues. The OX40-L protein is also claimed to generate a TH-2 immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             N-PSDB; AAV32636

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9
                                               The present sequence represents murine osteoclast differentiation can dactivation receptor (ODAR). The present invention describes costeoprotegerin (OPG) binding protein. Host cells transfected with vectors containing nucleic acid molecules encoding OPG binding protein care used to produce recombinant OPG binding protein. OPG binding protein cis used in binding assays to determine osteoprotegrin (OG) in biological cand antagonists, including intracellular protein); to raise Ab (useful cin immunoassays for detection of OPG binding protein) and to identify compounds that modulate binding of OPG binding protein to ODAR. The culcic acid molecule encoding OPG binding protein to DDAR. The culcic acid molecule encoding OPG binding protein can be used to detect COPG binding protein encoding sequences, e.g. screening for related complementary sequences, also to produce transgenic animal models, while complementary sequences are used for antisense regulation of OPG binding protein complementary soluble forms of OPG binding protein or Ab, are used to treat or prevent bone contenses, hypercalcaemia, Paget's disease, periodontal disease, with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

                                                                    CC factor-kappab (NF-kB)) polypetide which is a homolog of the human RANK. CC RANK is a member of the tumour necrosis factor (TNF) family. A soluble CC RANK may be used for inhibiting activation of NF-kB, by contacting a cell CC expressing membrane-associated RANK with a soluble RANK which binds to CC RANK ligand (RANKL). RANKL polypeptides can activate RANK and can be used to induce maturation of dendritic cells and enhance their CC allo-stimulatory capacity, thereby augmenting an immune response. The CC soluble RANK polypeptide composition may also be used for regulating an CC immune or inflammatory response. Inhibition of NF-kB by RANK antagonists CC may be useful in ameliorating negative effects of an inflammatory creations. They can also be used in adjunct therapy for disease CC characterised by neoplastic cells that express RANK. RANKL polypeptides CC can inflammatory response, and also for protecting RANK. RANKL polypeptides CC can inflammatory response, and also for protecting RANK. RANKL polypeptides CC can inflammatory response, and also for protecting RANK. RANKL polypeptides CC can inflammatory response, and also for protecting RANK. RANKL polypeptides CC can inflammatory response, and also be used for protecting RANK. RANKL polypeptides CC can also be used in hibitors of RANK and thus inhibitors of CC can inflammatory response, and also for protecting RANK. expressing cells companies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches

                                                                                                                                                                 This represents the murine muRANK (receptor activator of necrosis factor kappab (NF-KB)) polypetide which is a homolog of the human RANK. RANK is a member of the tumour necrosis factor (TNF) family. Host cells transformed or transfected with an expression vector comprising the RANK encoding nucleic acid can be used to produce recombinant RANK protein. The soluble RANK may be used for inhibiting activation of NF-KB, by contacting a cell expressing membrane-associated RANK with a soluble RANK which binds to RANK ligand (RANKL). The soluble RANK polypeptide composition may also be used for regulating an immune or inflammatory response. Inhibition of NF-KB by RANK antagonists may be useful in ameliorating negative effects of an inflammatory response that result from triggering of RANK, e.g. in treating toxic shock or sepsis, graft-cused in adjunct therapy for disease characterised by neoplastic cells that express RANK. The products can also be used for detection and drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        14-OCT-1997;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence is the osteoclast formation promoting factor (OBM) binding protein (OBM-BP) of the invention. The protein is useful as a preventive and/or treating agent for bone metabolic diseases such as osteoporosis. Substances which inhibit the binding of OBM to OBM-BP can be used as biochemical reagents.
                                                                                                                                                                                                                                                                                                                                              A mouse receptor activator of NF-kappaB designated RANK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    \mathsf{OBM}\text{-}\mathsf{BP};\ \mathsf{OBM}\ \mathsf{binding}\ \mathsf{protein};\ \mathsf{osteoclast}\ \mathsf{formation} bone metabolic disease; osteoporosis; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAY59509 standard; Protein; 625

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              regulating osteoclast generation and inhibiting osteoclast generation
CC in individuals inflicted with excess bone resorption. Especially, the
RANK protein is used to treat individuals at risk for excess bone loss,
CC osteoporosis, Paget's disease, bone cancer and cancers associated with
Nypercalcemia. The RANK protein ameliorates the effects of excess bone
CC loss, by binding to its ligand and inhibiting binding of other cells
CC expressing RANK. It thus decreases osteoclastogenesis when administered
CI into metastasising cancer, prostrate, hematologic, head and neck, and renal
CC melanomas, lung cancer, prostrate, hematologic, head and neck, and renal
CC which metastasise to bone and induce bone breakdown by locally disrupting
CC pathway. This results in the reduction in the osteoclast differentiation
CC pathway. This results in the reduction in the number of osteoclasts,
CC lesser bone rescorption and relief from the negative effects by
CC interfering with I/II signal transduction that leads to the
CC differentiation of osteoclasts
CC reportiation of captacolasts productors into osteoclasts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

The patent discloses novel receptor activator of nuclear factor (NF)-
CC kappab (RANK) proteins and their corresponding DNAs. RANK is a member
CC of the tumour necrosis factor (TNF) receptor superfamily and associates
CC with TNF receptor associated factor (TRAF) 2 and 3 which are important
CC in the regulation of immune and inflammatory response. The receptors
CC are useful for regulating immune response and in screening for inhibitors
CC of these receptors. The cytoplasmic domain of RANK is used in developing
CC assays for inhibit or so f signal transduction, e.g. for screening the
CC molecules that inhibit interaction of RANK with TRAF1, TRAF2, TRAF3,
CC TRAF5 and particularly TRAF6. NF-Rappab inhibition by RANK antagonists
CC are useful in ameliorating the negative effects of an inflammatory
CC response that result from triggering of RANK, e.g. in treating toxic
CC shock or sepsis, graft-versus-host reactions, acute inflammatory
CC reactions and the effects of bone resorption. RANK acts as an anti-
CC apoptotic signal and rescue the cells that express RANK from apoptosis.
CC soluble forms of the receptor are used in vitro based
CC screening tests for agonists or antagonists of RANK activity, as
CC antagonists of RANK mediated NF-kappa B activation, or to inhibit
CC transduction of a signal via RANK. RANK compositions are used in the
CC development of both agonistic and antagonistic antibodies, or as an
CC adjunct therapy for disease characterised by neoplastic cells that
CC express RANK. Compounds that interfere with RANK/TRAF6 interactions
CC are useful for modulating the formation of osteoclast from osteoclast
CC express RANK. Composing the formation of osteoclasts from osteoclast
CC are used as inhibitors of disease sassociated with excess bone resorption
CC and as immunosuppressants or anti-inflammatory agents. The RANK DNAs are
CC are useful in preparing kits for the detection of soluble RANK, or
CC and the presence or distribution of RANK transcripts, while the proteins
CC are useful.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          23-DEC-1996;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to receptor activator of NF-chi B (RANK) DNA. RANK is mapped to chromosome 18922.1 and its ligand (RANKL) to chromosome 13914. RANK and RANKL are type 1 and type 2 transmembrane. proteins respectively. RANK is a member of the tumour necrosis factor (TNF) superfamily and it closely resembles CD40 in the extracellular region. RANK associates with TNF receptor-associated factor (TRAF) 2 and TRAF3. The DNA molecules are useful for producing ligands of RANK. The ligands are useful for regulating immune response and in screening for any control of RANK. The present sequence is murine RANK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Key

The present invention relates to a novel receptor, referred to as RANK CC (receptor activator of NF (nuclear factor)-kappaB), a member of TNF CC (tumour necrosis factor) receptor superfamily. RANK is a Type I CC transmembrane protein that interacts with TNF receptor-associated CC factors (TRAFS). Triggering of RANK by overexpression or co-expression CC of RANK and membrane bound RANK ligand (RANKL) results in upregulation CC of the transcription factor WF-kappaB, a ubiquitous transcription factor CC that is most extensively utilised in cells of the immune system. CC inhibition of Nf-kappaB by RANK antagonists is useful in ameliorating CC negative effects of inflammatory reactions, and the effects of excess CC bone resorption. The RANK DNAS, proteins and their analogues are useful CC for the preparation of pharmaceutical compositions, for infecting target CC cells for use in gene therapy applications in diagnosing diseases CC associated with RANK, and as targets for use in screening assays. They can be used in the treatment or diagnosis of immune system dysfunction. The present invention also encompasses gene therapy methods to correct CC gene-activating mutations, associated with e.g. familial expansile costeolysis (FEO) and early onset paget's disease of bone (EP). The CC present amino acid sequence is murine RANK (murank) protein. This CC amino acid signal sequence, a 184 amino acid extracellular domain, a 21 amino acid transmembrane domain and a 390 amino acid cytoplasmic tail.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Key

                                                                                                                                                                                                                             The present sequence is a functional mouse acrosome reaction protein, PKDREJ or P3. PKDREJ is a sperm protein involved in binding the sperm to the egg and/or triggering the acrosome reaction. It exhibits homology to human polycystin-1 and surEJ. It can be used to identify antibodies or proteins that block the acrosome reaction and compounds that trigger acrosome reaction in the absence of zona protein can be used to increase fertility and those blocking its action can be used as contraceptives. DNA encoding PKDREJ can be used gene therapy and also as primer or probe for identifying sequences that encode mutant forms of acrosome reaction protein.

                                                                                                                         Ş
                                                                                                                                                                                                                                                       The invention relates to isolated polynucleotide (I) and C polyneptide (II) sequences. (I) is useful as hybridisation probes. CC polynerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CPCR) private polynucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC (II). (II) as useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical classing of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess blodiversity and to produce other types of data and products dependent on DNA and CC amino acid sequences. ABG00010-ABG30377 represent novel human CC diagnostic amino acid sequences of the invention.
                                                                                                                                                           Query Match
